

METHOD FOR PROVIDING CONTROL FOR AN INDUSTRIAL PROCESS USING ONE OR MORE MULTIDIMENSIONAL VARIABLES

ABSTRACT

5 A method for controlling an industrial process. The method includes
outputting a plurality of parameters from a process for manufacture of a substance. The
method also uses each of the plurality of parameters in a computer aided process, which
compares at least two of the plurality of parameters against a training set of parameters. The
training set of parameters is generally predetermined. A step of determining if the at least
10 two of the plurality of parameters are within a predetermined range of the training set of
parameters also is included. Additionally, the method includes outputting a result based upon
the determining step.
